Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
PS   Claim 1; Page 62-64; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

PT   New human transporters and ion channels (TRICH) polypeptides useful for
PT   diagnosing, treating or preventing disorders associated with aberrant
PT   expression of TRICH  -
XX
PS   Claim 11; Page 196-197; 210pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides and their cDNA molecules. The nucleic acid and polypeptide
CC   sequences are useful in the diagnosis, treatment, and prevention of
CC   disorders associated with transport (akinesia, cystic fibrosis, Bell's
CC   palsy, amyotrophic lateral sclerosis); neurological (Alzheimer's disease,
CC   amnesia, dementia); muscle (cardiomyopathy, myocarditis, Duchenne's
CC   muscular dystrophy); immunological (AIDS, Addison's disease, allergies,
CC   asthma); cell proliferative disorders (cancers, leukaemia, psoriasis);
CC   cardiac disease (angina, hypertension, or bradyarrythmia) and in the
CC   assessment of the effects of exogenous compounds on the expression of
CC   nucleic acid and amino acid sequences of transporters and ion channels.
CC   The polynucleotides may be used to detect and quantify gene expression
CC   in biopsied tissues in which TRICH expression may be correlated with a
CC   disease, to generate hybridization probes for mapping naturally occurring
CC   genomic sequence, and in drug screening. The present sequence is human
CC   TRICH-13 cDNA.

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

XX
PS   Claim 1; Page 69-70; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PS   Claim 1; Page 73-75; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening

CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are

XX
PS   Claim 1; Page 35-36; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
CC   The present invention describes human sodium channels SCN1A and SCN3A.
CC   The present sequence encodes the human sodium channel SCN1A. SCN1A and
CC   SCN3A have been located to the human chromosome 2 long arm, positions
CC   2q24 and 2q24-31 respectively. The sodium channel proteins are useful
CC   in studying the physiological mechanism in which excitant cells
CC   participate and cause human diseases, and in developing remedies for
CC   e.g. familial hypercalcaemic periodic paralysis of extremities and
CC   motor endplate disease.

PS Claim 1; Page 41-42; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are

```
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
PS   Claim 1; Page 46-47; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in

CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

XX
CC   The present invention provides a number of single exon nucleic acid
CC   probes which are derived from genomic sequences expressed in the human
CC   brain. They can be used to measure gene expression in brain cell samples,
CC   which may enable the diagnosis and improved treatment of nervous system
CC   diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
CC   epilepsy and cancers. The present sequence is one of the probes of the
CC   invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DEFINITION  Rattus norvegicus sodium channel I mRNA, complete cds.
ACCESSION   M22253
VERSION     M22253.1  GI:1041088
KEYWORDS    Na+ channel; sodium channel.
SOURCE      Rattus norvegicus cDNA to mRNA.
  ORGANISM  Rattus norvegicus
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
            Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae;
            Rattus.
REFERENCE   1  (bases 1 to 8399)
  AUTHORS   Noda,M. and Numa,S.
  TITLE     Structure and function of sodium channel
  JOURNAL   J. Recept. Res. 7 (1-4), 467-497 (1987)

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

PT   New human transporters and ion channels (TRICH) polypeptides useful for
PT   diagnosing, treating or preventing disorders associated with aberrant
PT   expression of TRICH -
XX
PS   Claim 11; Page 196-197; 210pp; English.
XX
CC   The invention relates to human transporters and ion channels (TRICH)
CC   polypeptides and their cDNA molecules. The nucleic acid and polypeptide
CC   sequences are useful in the diagnosis, treatment, and prevention of
CC   disorders associated with transport (akinesia, cystic fibrosis, Bell's
CC   palsy, amyotrophic lateral sclerosis); neurological (Alzheimer's disease,
CC   amnesia, dementia); muscle (cardiomyopathy, myocarditis, Duchenne's
CC   muscular dystrophy); immunological (AIDS, Addison's disease, allergies,
CC   asthma); cell proliferative disorders (cancers, leukaemia, psoriasis);
CC   cardiac disease (angina, hypertension, or bradyarrythmia) and in the
CC   assessment of the effects of exogenous compounds on the expression of
CC   nucleic acid and amino acid sequences of transporters and ion channels.
CC   The polynucleotides may be used to detect and quantify gene expression
CC   in biopsied tissues in which TRICH expression may be correlated with a
CC   disease, to generate hybridization probes for mapping naturally occurring
CC   genomic sequence, and in drug screening. The present sequence is human
CC   TRICH-13 cDNA.

PT   screening, diagnosis and in gene therapy of biological disorders
XX
PS   Claim 2; Page 55-57; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

LOCUS       HUMHBAX                 6328 bp    mRNA    linear   PRI 09-JUN-1994
DEFINITION  Human voltage-gated sodium channel mRNA, complete cds.
ACCESSION   M94055
VERSION     M94055.1  GI:456678
KEYWORDS    sodium channel alpha subunit; voltage-sensitive sodium channel.
SOURCE      Homo sapiens cDNA to mRNA.
  ORGANISM  Homo sapiens
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
            Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

LOCUS       RATNACHII              8552 bp    mRNA    linear   ROD 26-OCT-1995
DEFINITION  Rattus norvegicus sodium channel II mRNA.
ACCESSION   M22254
VERSION     M22254.1  GI:1041090
KEYWORDS    Na+ channel; sodium channel.
SOURCE      Rattus norvegicus cDNA to mRNA.
  ORGANISM  Rattus norvegicus
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
            Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae;
            Rattus.

PT   Determining a predisposition to epilepsy and/or development of epilepsy
PT   comprises determining the genotype of SCN1A, SCN2A and/or SCN3A, or a
PT   DNA variant, equivalent, or mutation which shows a linkage
PT   disequilibrium -

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

XX
PS   Claim 1; Page 28-30; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

XX
CC   The present invention describes human sodium channels SCN1A and SCN3A.
CC   The present sequence encodes the human sodium channel SCN1A. SCN1A and
CC   SCN3A have been located to the human chromosome 2 long arm, positions
CC   2q24 and 2q24-31 respectively. The sodium channel proteins are useful
CC   in studying the physiological mechanism in which excitant cells
CC   participate and cause human diseases, and in developing remedies for
CC   e.g. familial hypercalcaemic periodic paralysis of extremities and
CC   motor endplate disease.

XX
PS   Claim 1; Page 62-64; 83pp; English.
XX
CC   The present sequence is a cDNA encoding novel human protein (NHP), ion
CC   channel protein. NHP share structural similarity with mammalian sodium
CC   channel proteins particularly voltage-gated sodium channel proteins.
CC   NHP oligonucleotides are useful as hybridisation probes for screening
CC   libraries and assessing gene expression patterns. Sequences derived
CC   from regions adjacent to the intron/exon boundaries of NHP gene can be
CC   used to design primers for use in amplification assays to detect
CC   mutations within the exons, splice sites, introns that can be used in
CC   diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC   for drug screening effective in the treatment of symptomatic or
CC   phenotypic manifestations of perturbing the normal function of NHP in
CC   the body, and nucleotide constructs encoding NHP products are useful to
CC   genetically engineer host cells to express NHP products in vivo. These
CC   genetically engineered cells function as bioreactors in the body
CC   delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC   protein to the body. Nucleotide construct encoding NHP products are
CC   also useful in gene therapy for modulating NHP expression and to
CC   produce genetically engineered host cells to express NHP products in
CC   vivo. NHP nucleotide sequences may also be used as part of ribozyme
```

```
CC   and/or triple helix sequences that are useful for NHP gene regulation.
CC   The NHP polypeptides are useful for generating antibodies, as
CC   reagents in diagnostic assays, for identifying other cellular gene
CC   products related to NHP and as reagents in assays for screening for
CC   compounds that are useful in the treatment of mental, biological or
CC   medical disorders and diseases.

PS Claim 1; Page 35-36; 83pp; English.
XX
CC The present sequence is a cDNA encoding novel human protein (NHP), ion
CC channel protein. NHP share structural similarity with mammalian sodium
CC channel proteins particularly voltage-gated sodium channel proteins.
CC NHP oligonucleotides are useful as hybridisation probes for screening
CC libraries and assessing gene expression patterns. Sequences derived
CC from regions adjacent to the intron/exon boundaries of NHP gene can be
CC used to design primers for use in amplification assays to detect
CC mutations within the exons, splice sites, introns that can be used in
CC diagnostics and pharmacogenomics. NHP nucleotide sequences are useful
CC for drug screening effective in the treatment of symptomatic or
CC phenotypic manifestations of perturbing the normal function of NHP in
CC the body, and nucleotide constructs encoding NHP products are useful to
CC genetically engineer host cells to express NHP products in vivo. These
CC genetically engineered cells function as bioreactors in the body
CC delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion
CC protein to the body. Nucleotide construct encoding NHP products are
CC also useful in gene therapy for modulating NHP expression and to
CC produce genetically engineered host cells to express NHP products in
CC vivo. NHP nucleotide sequences may also be used as part of ribozyme
CC and/or triple helix sequences that are useful for NHP gene regulation.
CC The NHP polypeptides are useful for generating antibodies, as
CC reagents in diagnostic assays, for identifying other cellular gene
CC products related to NHP and as reagents in assays for screening for
CC compounds that are useful in the treatment of mental, biological or
CC medical disorders and diseases.

PT   Determining a predisposition to epilepsy and/or development of epilepsy

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

PT   Determining a predisposition to epilepsy and/or development of epilepsy

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

XX
CC The present invention describes human sodium channels SCN1A and SCN3A.
CC The present sequence encodes the human sodium channel SCN3A. SCN1A and
CC SCN3A have been located to the human chromosome 2 long arm, positions
CC 2q24 and 2q24-31 respectively. The sodium channel proteins are useful
CC in studying the physiological mechanism in which excitant cells
CC participate and cause human diseases, and in developing remedies for
CC e.g. familial hypercalcaemic periodic paralysis of extremities and
CC motor endplate disease.

CC The present invention describes a method (M1) of determining an
CC individual's predisposition to epilepsy and/or development of epilepsy,
CC as well as predicting the individual's response to medication. The
CC method comprises determining the genotype of at least one gene selected
CC from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC sodium channel genes located on chromosome 2. The idiopathic generalised
CC epilepsy (IGE) gene is more specifically localised on chromosome
CC 2q23-q31. Compounds identified as modulators of the biological activity
CC of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC epilepsy or other neurological disorders. They have anticonvulsant and
CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC primers, oligonucleotides and proteins given in the exemplification of
CC the present invention.

CC   The present invention describes a method (M1) of determining an
CC   individual's predisposition to epilepsy and/or development of epilepsy,
CC   as well as predicting the individual's response to medication. The
CC   method comprises determining the genotype of at least one gene selected
CC   from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation
CC   which shows a linkage disequilibrium. SCN1a, SCN2A and SCN3A are all
CC   sodium channel genes located on chromosome 2. The idiopathic generalised
CC   epilepsy (IGE) gene is more specifically localised on chromosome
CC   2q23-q31. Compounds identified as modulators of the biological activity
CC   of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating
CC   epilepsy or other neurological disorders. They have anticonvulsant and
CC   neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to
CC   AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAs, gene fragments, PCR
CC   primers, oligonucleotides and proteins given in the exemplification of
CC   the present invention.

PT   Predicting toxic effects of compounds or the progression of these toxic
PT   effects by determining the changes in gene expression in tissues or
PT   cells exposed to the toxin and comparing these to gene expression in
PT   unexposed tissues or cells -
XX
PS   Claim 1; Seq ID No 1604; 239pp; English.
XX
CC   The invention relates to methods for predicting toxic effects of
CC   compounds or the progression of these toxic effects by determining the
CC   global changes in gene expression in tissues or cells exposed to the
CC   toxin and comparing these to gene expression in unexposed tissues or
CC   cells. Also included are methods of predicting at least one toxic
CC   effect of a compound or progression of a toxic effect, preferably the
CC   hepatotoxicity of a compound, comprising detecting the level of
CC   expression in a tissue or cell sample exposed to the compound of two or
CC   more genes listed in the specification, where  differential expression of
CC   the genes is indicative of at least one toxic effect or progression.
CC   The method can also be used to identify an agent which modulates the
CC   toxic response and predict cellular pathways that a compound modulates
CC   in a cell. The methods utilise a set of at least two probes (on a solid
CC   support in kit form), where each of the probes comprises a sequence that
CC   specifically hybridises to a gene listed in the specification, a computer
CC   system comprising a database containing information identifying the
CC   expression level in a tissue or cell sample exposed to a hepatotoxin of a
CC   set of genes comprising at least two genes listed in the specification,
CC   and a user interface to view the information used to present information
CC   identifying the expression level in a tissue or cell of at least one gene
CC   listed in the specification. The method is useful for elucidating global
CC   changes in gene expression and for identifying toxicity markers in
CC   tissues or cell exposed to a known toxin. The genes may be used as
CC   toxicity markers in drug screening and toxicity assays. The genes and
CC   gene expression information may be used as diagnostic markers for the
CC   prediction or identification of the physiological state of tissue or cell
CC   sample that has been exposed to a compound or agent. Hepatotoxicity
CC   is characterised by centrilobular necrosis and steatosis. The present
CC   sequence is an expressed sequence tag (EST) or cDNA derived from a gene
CC   which is differentially expressed in response to a hepatotoxic agent.

PS Example 4; Fig 14; 80pp; English.
XX
CC The sequence encodes a human peripheral nervous system sodium channel
CC peptide-1 alpha-subunit (PN1B), with sodium channel activity. A
CC probe has been isolated by PCR from a human peripheral nervous
CC system cDNA library, using probes derived from the rat PN1 protein

CC sequence (AAR99638-39), and has been used to screen a human dorsal
CC root ganglion cDNA library, to give the full-length sequence, using
CC PCR primers AAT30198-99 and AAT18167. A related sequence (AAT30194) has
CC also been isolated. The sodium channel peptide may be used to
CC isolate sodium-agonists and sodium-antagonists for use as
CC analgesics, hypotensives, antiinflammatories, and in therapy of
CC sodium channel-associated pathology or trauma, e.g. neurological
CC disorders. The DNA (in sense or antisense orientation) may be used
CC in gene therapy.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

;    APPLICANT:  DELGADO, STEPHEN G.
;    APPLICANT:  DIETRICH, PAUL S.
;    APPLICANT:  FISH, LINDA M.
;    APPLICANT:  HERMAN, RONALD C.
;    APPLICANT:  SANGAMESWARAN, LAKSHMI
;    TITLE OF INVENTION:  NOVEL CLONED TETRODOTOXIN-SENSITIVE
;    TITLE OF INVENTION:  SODIUM CHANNEL I-SUBUNIT AND A SPLICE VARIANT THEREOF
;    NUMBER OF SEQUENCES:  43
;    CORRESPONDENCE ADDRESS:
;      ADDRESSEE:  JANET PAULINE CLARK
;      STREET:  3401 HILLVIEW AVENUE, MS A2-250
;      CITY:  PALO ALTO
;      STATE:  CA
;      COUNTRY:  U.S.A.
;      ZIP:  94304-1397
;    COMPUTER READABLE FORM:
;      MEDIUM TYPE:  Floppy disk
;      COMPUTER:  IBM PC compatible
;      OPERATING SYSTEM:  PC-DOS/MS-DOS
;      SOFTWARE:  PatentIn Release #1.0, Version #1.30
;    CURRENT APPLICATION DATA:
;      APPLICATION NUMBER:  US/09/024,020B
;      FILING DATE:  16-FEB-1998
;      CLASSIFICATION:  536
;    PRIOR APPLICATION DATA:
;      APPLICATION NUMBER:  US 60/039,447
;      FILING DATE:  26-FEB-1997
;    ATTORNEY/AGENT INFORMATION:
;      NAME:  CLARK, JANET P.
;      REGISTRATION NUMBER:  34,799
;      REFERENCE/DOCKET NUMBER:  R0020B-REG
;    TELECOMMUNICATION INFORMATION:
;      TELEPHONE:  (650) 852-3097
;      TELEFAX:  (650) 855-5322
;  INFORMATION FOR SEQ ID NO:  8:
;    SEQUENCE CHARACTERISTICS:
;      LENGTH:  6826 base pairs
;      TYPE:  nucleic acid
;      STRANDEDNESS:  single
;      TOPOLOGY:  linear
;    MOLECULE TYPE:  DNA (genomic)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
